canon eos d60 service manual

This CDROM covers all localities where the products are sold. For this reason, there may be information in this CDROM that does not apply to the product sold in your locality. Refer to the products instruction book if necessary. Part 2 Technical Information Provides technical information about the mechanism and electronics of the product. The EOS D60s improvements over the EOS D30 are outlined below. All specifications not mentioned below are the same as the EOS D30. The EOS D60 has a larger buffer memory to better handle the images larger data resulting from the high pixel count. The maximum burst of 8 shots can be attained regardless of the imagerecording format and ISO speed. Images captured by the EOS D60 can then be easily copied to the Mac. The picture is taken when the shutter button is let go and pressed completely again. Mirror lockup duration Max. 30 sec. after which the mirror returns. If a moving subject is detected, all three AF points are used to focus. When one of the AF points detect a moving subject, it switches to AI SERVO AF. Pressing this button fires a preflash and the AE sensor meters by partial metering the light reflected off the main subject. The suitable flash output is then calculated and stored in memory. When the shutter button is pressed fully, the flash is fired at the output stored in memory. OPERATION CAUTIONS 10.1 Operaton Cautions 140. Primarycolor filters are used to obtain accurate and vibrant color reproduction. All the ISO speeds are equivalent to the respective film speeds. Although ISO 1600 is provided by the EOS D30, the EOS D60 does not. However, with the EOS D60, the processing parameters can be set with the menu functions displayed on the rear LCD monitor. The AFassist light is linked to the three AF points. With the EOS D60, a maximum burst of 8 is possible in the RAW mode. They are looping menus. As a result, the shutter release time lag is now shorter and more stable. <http://www.fafor.pl/img/hp-2200-parts-manual.xml>

Regardless of the shutter speed, the shutterrelease time lag stopdown by up to 4.5 stops from maximum aperture and excluding AF operation time will be as. The image quality is now better than the EOS D30s even without noise reduction. The following are descriptions of the four major circuit boards. Super impose SP Light PCB CMAIN PCB Fig. Major Components Function IC3CPU Reads all operation and status switches, and controls USB communication, video output, camera sections imaging and power source. IC15, IC6 Video amp Video signal amp Interface part Cable release part and USB communication part. The video signal is output from the C MOS sensor when it is driven by the drive pulse. In the cameras inhibit mode, Err XXX is displayed. The user can see five types of error codes. Using the service adjustment software, you can check the detailed error codes and also erase error codes. Coat the face of back cover dial with PL015 Spring Ball Fix it using D1663B Be careful Loose LED window parts. Insert the tweezers Be careful from inside and Loose remove it upwards. No adjustment is required for the CMOS sensor service parts pre CAUTION adjusted at the factory. Perform the FFD Adjustment when tilt focus error occurs when the EOSD60 receives shock such as being dropped. The sensor focus point and the finder focus point must be the same. When doing so, take care not to push too strongly. If you do, the spring pressure of the focusing screen retainer becomes weak. Removing the DIGITAL block takes time and using the histogram display function enables judgment of exposure and shutter without removing it. Let the camera close the shutter at each luminance level. 3 When the exposure is correct, the correct histogram as shown in the right appears. After the AF adjustment, photograph a 3D chart. If fine adjustment is necessary, adjust by shifting the AF focus. And if the digital sections ISO setting is adjusted correctly, the digital section should obtain the correct exposure. If it is not generated, the correct color reproduction will not occur. Do the regular maintenance data generation. For digital cameras, maintaining the light source is very important for adjusting the ISO sensitivity. With the EOS D60, the standard amount of light for each ISO speed is set based on the LV12 light source. The defect location coordinates to be input are also based on the RAW image. Set the image so that defects can be distinguished. Select the AjDef0. img, and AjObSkio. After the AF adjustment, photograph a 3D chart and CAUTION check the focus. If fine adjustment is necessary, adjust by shifting the AF focus. If you do not use the software, you will need a small flashlight and very refined servicing skills. The procedure without the adjustment software is explained below. Note, however, that to respond to user preferences e.g.

stronger red, blue is too predominant, reference data must be changed, re adjusted, and checked. CAUTION When the defragmentation of the adjustment of adjustment area is done, the data will not to be deleted. Images can also be downloaded to the computer by a card reader. The main driver functions are listed in the table below. Images shot. CN2 are not detected. 2 When the shutter operation sequence was not completed correctly.
