The physical condition is excellent, and except for one small blemish on the case, it might pass for new. When I originally received the instrument several months ago, I powered it up to see if it could get through the onboard diagnostics; it passed all of these tests and went on the shelf until I could devote more time to the project. It's now back on the bench and I am starting to dig in.

In this process I noticed two issues that I'd like to learn more about It is readable in every case, but the brightness varies within each character. The signal trace and graticule traces do not have this problem. I looked through the service manual and it mentions something like this but the

troubleshooting tips seem vague and limited in scope. Or is it 6043.2 hours, with the decimal point missing. Seems unlikely to me that it could be the higher number, but perhaps so. Neither the User or Service manual seem to give definitive info on the format of this number. Given the nice overall condition of this instrument, I am somewhat inclined to invest some dollars to deal with known issues which arise with these instruments over time. Any pointers to a guru who would be willing to take this on also appreciated. Sounds like a lot of time, but if it works as you describe, I would not be concerned. Sounds like a lot of time, but if it works as you describe, I would not be concerned. I They also sell through the well known auction site. Since so many adjustments are dependent on X CRT divisions either in the X or Y dimensions a solid display system is a must. Also the LCD display adds value to the instrument as it makes it equivalent to a EC series of the same scope with the same multicolor display. Have been looking at this. Just need the courage! Bill Lauchlan So now you can watch a large LCD screen while making measurements or working on a piece of gear. Put said LCD on a flexible mount and you can see it from anywhere you are working. I did this with a 3562A whose display was limping along and I am very happy with the results. The good news is that the end result is quite nice. The bad news is that the install, with my limited recent experience in such matters, seems in the same league as a heart transplant. It's the kind of thing where you'd much prefer the person doing the conversion had done it at least a few times previously.

So far, I have never seen an 8560E with the case off. Just getting the anatomy understood will be a challenge. I'd much rather commission an 8560 expert who has done this before to install this mod, preemptively replace components which commonly fail, and do a calibration, etc. Short of this, I may wait for a serious failure that leaves no choice but to open it up and jump in. In the meantime, I will keep looking at the photos of the end result for motivation. OTTH, I recently tore into a Tek 495P SA also had never previously had the case off which had problems and found and fixed the problem without much difficulty. This was relatively easy however sourcing a replacement memory board on eBay, recapping, and programming the firmware EPROMs. Maybe I can do this. Thanks Shaun, for the link. This may tip me over to go ahead. This may tip Boston metro area Boston metro area Characters formed by straight line segments do not exhibit the intensity variation. The character currently selected appears at a higher intensity than the other characters. As the controls are used to step through the characters, each character is intensified in turn. A the intensified level of brightness, the nonuniform intensity described above is not seen. IOW, all characters are uniformly bright. Have not yet removed the case trying to think through the possibilities before I start changing things. I have the manual, but I dont have the arsenal of test gear recommended in the manual and am probably not going to have this gear in the foreseeable future. I may resort to winging it a bit.

Are there differences in brightness of horizontal vs. No straight lines, whether vertical, horizontal or diagonal are uniformly bright. RB The characters are drawn as vectors not as a bitmap and a raster scan. Hence the distortion seen on the screen as the electron gun can no longer generate a tight beam of electrons. The HP CRT's were incredible to look at when new but the design of the tube is unique to HP and it has a fatal flaw which shows up after years of service. Unfortunately NOS tubes and good used tubes are approaching and in many cases surpassing the price of the Newscope upgrades. I think you will find that after doing the 15 page CRT alignment process that your 8560E will have the same symptoms as before. Here's an article from another member here describing the failure

What about things like speed, brightness, Chuck Harris Scott McGrath wrote The characters are drawn as vectors not as a bitmap and a raster scan. I think you will find that after doing the 15 page CRT alignment process that your 8560E will have the same symptoms as before. Here's an article from another member here describing the failure Content by Scott Typos by Siri While the appearance of my CRT is decidedly different from any of the photos at this link, as you suggest, cathode poisoning may well be the culprit. My plan of attack It requires installing five DIP sockets on top of existing soldered in DIP ICs and soldering these to the IC pins.

They insisted on mil quality soldering, so I can hopefully call up those skills one more time. However, IC's were still some years off at that time. It may be safe to assume that the unit still has the original CRT in it. The CRT probably has what is known as cathode poisoning. This is where the cathode is contaminated and the crt may not have the electron emission required to do fast writes required on curves. Can you post some pictures of your CRT showing the anomalies. Have a look here for some ideas this is for a HP8566 but the CRT drive concepts are the same vector approach. Sam W3OHM Sam Reaves Groups LeCroy Owners Group on Groups.io backup group Has anyone tried it. Is it an upgrade, or a downgrade from a working original CRT. That's what was used in the later 8560EC series. The latter have 1001 points of display resolution while the portables only have 601. For some reason SimmConns page for the 85662A display says that XGA resolution requires a special order. I guess there's some sticker shock involved, because I can't think of any other reason not to go with XGA when upgrading the big iron hardware. john, KE5FX The Group moderators are responsible for maintaining their community and can address these issues.
